

Prism Versions

V1 Prompt

Build a web application called Prism.

Prism is an AI-powered exploration tool that helps users understand unfamiliar topics by organizing information through multiple perspectives.

The problem:

Most digital experiences require users to search, filter, or browse through structures designed by the system. Prism helps users explore information through the perspective that is most useful for their goal.

Core experience:

1. User enters a topic they want to understand.

Example:

Coffee

2. Prism generates multiple perspectives for exploring that topic.

Example perspectives:

- Beginner: "Help me understand the fundamentals"
- Buyer: "Help me make a decision"
- Scientist: "Help me understand how it works"
- Environmentalist: "Help me understand the impact"
- Cultural: "Help me understand its history and significance"

3. User selects a perspective.

4. Prism displays the topic reorganized through that perspective.

The MVP should demonstrate that the same topic can be understood differently depending on the user's intent.

Create the following backend data structure:

Topic:

- Name
- Description

Perspective:

- Name
- Description
- Associated Topic

Concept:

- Name
- Description
- Associated Topic

Relationship:

- Source Concept
- Relationship Type
- Target Concept

Build the following screens:

1. Landing / Topic Input

- User enters a topic to explore.

2. Perspective Selection

- Display AI-generated perspective cards.

3. Exploration View

- Display concepts and relationships organized through the selected perspective.

The first demo should use Coffee as the example topic.

Example output:

Coffee viewed as a Beginner:

- Origins
- Types of beans
- Brewing methods
- Flavor basics

Coffee viewed as a Buyer:

- Price
- Quality indicators
- Roast preferences
- Equipment choices

Prioritize:

- Clear user experience
- Visual demonstration of multiple perspectives
- Simple backend relationships
- A polished demo flow

Do not build:

- Social features
- Mobile app
- Browser extensions
- User accounts
- Complex personalization
- External integrations

V1 Review

Summary

- The first Prism prototype successfully demonstrates the core concept:
- The visual design feels polished and AI-native.
- The core concept is understandable.

What is working

1. Perspective-based exploration is clear
 - a. The user understands: "I can look at the same topic from different angles."
2. The relationship model is promising
 - a. The Connections section surfaced an interesting backend capability:
 - b. This suggests Prism is not only organizing information by categories but also revealing relationships between concepts.

Problems Identified

1. The experience currently ends too quickly
 - a. The product currently feels like a presentation instead of an exploration system.
 - b. The user needs more opportunities to continue navigating.
2. Concepts are not interactive
 - a. Users cannot go deeper or understand why concepts matter.
3. Connections are interesting but not actionable
4. Missing persistent exploration controls
 - a. Exploration requires a loop.

V1 → V2 Iterative Improvements

1. Create an exploration loop
 - a. Add persistent actions throughout the experience:
2. Make concepts expandable
 - a. Concepts should become entry points.

3. Make relationships navigable
 - a. Allow users to click relationships and continue exploring.
4. Add exploration context
 - a. Maintain user orientation.
 - b. This helps users understand where they are.

V2 Prompt

Improve the Prism application based on the first prototype review.

The current experience successfully demonstrates multiple perspectives, but the exploration flow ends after showing concepts. Update the app to create a continuous exploration experience.

Goals:

1. Add persistent exploration actions throughout the app:

- Explore another perspective
- Explore related concepts
- Search a new topic

2. Make concepts interactive:

When a user selects a concept, display:

- Concept explanation
- Related concepts
- Relevant relationships
- Additional perspectives for exploring that concept

3. Make relationships interactive:

The Connections section should allow users to navigate between related concepts instead of only displaying relationships.

Example:

Roasting → influences → Flavor

Flavor → depends on → Extraction

Users should be able to click through these relationships.

4. Add navigation context:

Include breadcrumbs showing the user's exploration path.

Example:

Coffee → Buyer Perspective → Espresso Machines

5. Preserve the core Prism experience:

Topic → Perspectives → Exploration → Relationships → Deeper Exploration

Prioritize creating a loop where users can continue discovering information instead of reaching an endpoint.
